/note="Vector: Lambda Uni-ZAP XR, excised phagemid;
Site_1: EcoRn: Site_2: Nho!: Seeds were surface-sterilized
site_1: EcoRn: Site_2: Nho!: Seeds were surface-sterilized
, germinated and grown aseptically in the dark at room
temperature on filter paper with water, nystatin and
cefotaxime in covered crystallization dishes. Roots were
harvested. The tissue, total RNA, and poly(A) RNA were
prepared, a cDNA library was made, and the cDNA clones
were in vivo excised to give pBluescript phagemids in the
TJ Close lab (Choi, Close, Fenton) at the University of
California, Riverside. Plasmid DNA preparations and DNA
sequencing were performed in the OD Anderson lab (all
other authors)."

                                                                         The present cDNA sequence encodes the C-terminal half of corn zeaxanthin epoxidase which is a carotenoid biosynthetic enzyme. The sequence comprises a contig derived from clones crln.pk0033.d8 (from corn root cDNA library), p0110.c9smp011. p0012.cglae05r and p0088.clrim55r (last three clones from corn leaf tissue cDNA libraries). The present sequence is used for construction of chimeric gene to alter expression of the enzyme in transformed cell. The enzyme can be used to raise cantibodies and identify compounds that inhibit the activity of carotenoid biosynthetic enzyme. The polynucleotide also serves as a source of probes and primers which are useful for genetic mapping and to isolate homologous sequences from other species.
                                                                                                                                                                                                                                                                                                                                                                                                             240 tttttttattcgtcgcgttttagttcaaacatgaactagcggacgactgatattcgagaa 299
Novel carotenoid biosynthesis enzyme polynucleotides and polypeptides used to identify inhibitors and to mödulate expression of the enzyme

The present sequence encodes a Rice D-ribulose-5-phosphate-3-epimerase (RPE) nematode response protein. The enzyme is activated during the initial stages of nematode infestation of roots and is required for formation of the giant feeder cells on which the nematodes depend. Interfering with expression of the protein will thus inhibit nematode infestation. The RPE polynucleotide is used to produce transgenic plants (specifically potato, tomato, beet, rape and rice) that are resistant (or at least less susceptible) to nematode in the plant; or by using the promoter of the RPE gene to express an in the plant; or by using the promoter of the RPE protein or gene enables plant to mount an immediate response to the linvasion of the nematode, consequently limiting the level of cellular damage and reducing the

during the initial stages of nematode incertain. The enzyme is activated during the initial stages of nematode infestation of roots and is depindent of for formation of the giant feeder cells on which the nematodes required for formation of the giant feeder cells on which the nematodes of nematode infestation. The RPE polynuclectide is used to produce transgenic plants (specifically potato, tomato, beet, rape and rice) that are resistant (or at least less susceptible) to nematode infestation. This is achieved by either expressing antisense sequences in the plant; or by using the promoter of the RPE gene to express an anti-nematode protein. Inhibition of the RPE protein or gene enables consequently limiting the level of cellular damage and reducing the complications of secondary infections.
                                                                    Nucleic acid encoding D-ribulose-5-phosphate-3-epimerase is used to increase resistance to root nematodes
                                                                                                                                                                                  present sequence encodes an Arabidopsis D-ribulose-5 phosphate-

```
A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences quiven in T19001-T25837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed CDNA libraries prepared from various human tissues; synthesis of CDNA was initiated from the untranslated sequence is unique to a particular mRNA species, almost length or contented cDNA hybridise with specific mRNA species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                57 tggtctaggtccttcaaccatagacgtggccgcatctgctgggggccaattgcatcgtcgc 116
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

                                                                                                                                                                                                          human colorectal adenocarcinoma (colon cancer) cell line SW480. The cDNA clones can be used to generate antisense oligonucleotides which can be used for antisense therapy. Methods and products from the present invention can be used for identifying and/or classifying cancerous cells present in a human tumour, particularly in solid tumours, e.g. carcinomas and sarcomas, e.g. breast or colon cancers. The cDNA clones can be used for developing agents for the diagnosis and treatment of disorders in the colon cancers in the colon cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             279917 to 280766 represent double stranded cDNA clones isolated from the

                                                     present in a human tumour, particularly in solid tumours, e.g. carcinomas and sarcomas, e.g. breast or colon cancers. The cDNA clones can be used for developing agents for the diagnosis and treatment of disorders involving unwanted cell proliferation, such as neoplasia, dysplasia or
human colorectal adenocarcinoma (colon cancer) cell line SW480. The CDNA clones can be used to generate antisense oligonucleotides which can be used for antisense therapy. Methods and products from the present invention can be used for identifying and/or classifying cancerous cells
                                                                                                                                                                                                                                         352 regrecaderecaacaacaeradeaereecreerreregrecregrariegaacaerer 293

                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                             The Id gene controls flower evocation in maize plants. The maize nucleic acid is similar to that of genes encoding zincfinger regulatory proteins in animals.

Transposons Ac and Ds constitute a family of related transposable elements present in maize. A derivative of Ds, Ds2, can be used to produce a new mutant of the Id gene. The Ds2 (in the presence of active Ac) is excised from a nearby gene on chromosome 1 and inserted into the Id gene to produce id*.

The maize Id gene controls floral induction and is useful in the production of transgenic plants with altered floral induction times, i.e. earlier, delayed or inhibited floral induction. The Id gene and zinc finger regulatory regions are useful to identify these genes in maize and isolate similar genes in other plants. The polypeptides and antibodies are also useful in Id detection e.g. to locate activity in

This sequence represents the maize chromosome 1 indeterminate (Id)

ce gene. Ds2 transposon insertion occurs at nucleotide 914 of the

ce gene. The Id gene encodes a regulatory protein (see Ya2114) that

plays a crucial role in the switch from vegetative to reproductive

ce plays a crucial role in the switch from vegetative to reproductive

chevelopment, controlling the expression of other genes required for

floral development. Iloss of Id function causes prolonged vegetative

ce development. Understanding the mechanism of this regulation

crowides a basis for producing specialized plants designed to flower

ce nowironmental effects. Methods are provided for producing plants

ce nowironmental effects. Methods are provided for producing plants

ce nowironmental effects. Methods are provided for producing plants

ce with selected times of transition from the vegetative to the

crow egetative growth and initiation of flowering, or in later

consecuting or the absence of floral induction. The plants can be

consecuted to flower and set seed prior to adverse weather. Similarly,

cflower induction can be prolonged for short-season plants grown in

areas with long periods of warm weather. As a result of the extra

consecutive mass and carbohydrate, these plants can produce more and/or

larger flowers and, consequently, more seed. Plants can even be

consecuted from flowering, thus providing nutritious silage blomass.

consecution of hybrids.

consecution of hybrids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated floral induction gene, used for producing plants with selected times of transition from the vegetative to the flowering stage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         i

                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acid encoding plant cystathionine gamma synthase - used to increase the methionine content of seeds for improvement of animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Four chimeric genes encoding (1) a plant cystathionine gamma synthase (CS); (2) a feedback insensitive aspartokinase (lysc), operably linked to a chloroplast transit sequence; (3) a bifunctional feedback insensitive aspartokinase homoserine dehydrogenase (AK-HBH), operably linked to a chloroplast transit sequence; and (4) a methionine rich storage protein (HSZ); all being operably linked to plant seed specific regulatory sequences, are used for increasing the methionine content of the seeds of plants. Plants having increased methionine content may be used to produce improved animal feeds.

The present invention describes a clausionmew cereat plant, seculose and operated lavel of at least one preselected amino a coid (aa) compared to a seed from a corresponding untransformed plant, where the aa is selected from lysine, cysteine, threonine, tryptophan, carginine, laucine, laoleucine, histidine or their combinations, and optionally methionine. Plants transformed to express a heterologous protein that has an elevated content of a preselected amino acid can be content of the preselected amino acid, and therefore having an increased content of the preselected amino acid, and therefore having an increased noutritional value. The transformed cereals can be used in feed formulations for animals. Transforming plants to have an elevated lavel of a preselected amino acid in the endosperm of its seed is advantageous of a preselected amino acid in the endosperm of its seed is advantageous of a preselected amino acid in the endosperm of its seed is advantageous cupplementation with specific amino acids to provide animals with content of the seeds without derrimental side increase the nutritional content of seeds without derrimental side cutritional content of the seeds is increased whilst maintaining a high cleast 10-20% by weight to about 10 times greater compared to a corresponding untransformed seed. The present sequence represents a chierry derived from the barley (Hondem vulgare) alpha hordothionin content of the area (The present sequence represents a chierry derived from the barley (Hondem vulgare) alpha hordothionin content of the reads (The present sequence represents a chierry derived from the barley (Hondem vulgare) alpha hordothionin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Plant seeds containing elevated preselected amino acid levels, used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

isolated from a family of maize (Zea mays) genes encoding pathogenesis related (PR-1) proteins. The promoters are useful for expressing heterologous genes (including genes for disease resistance) in plants, especially diccts, or monocots i.e. maize. The promoters are useful for the genetic manipulation of plants to exhibit specific phenotypes, particularly enhanced resistance to pathogen caused disease. Pathogens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              223 aaagtactccctccgtttttttttttttcgtcgcgttttagttcaaacatgaactagcgga 282

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence encodes a Mycobacterium tuberculosis protein. Products from the present invention, which describes protein fragments and nucleic acid fragments derived from M.tuberculosis, can be used in the detection of and prevention of mycobacterial infections. In particular, the proteins and nucleic acids can be used for the diagnosis of or vaccination against tuberculosis caused by M. tuberculosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      163 ccggcgatgggcatggggggtgtgggtgtttagatgcggccggttccggcgagggcggc 222

The invention describes a substantially pure immunogenic polypeptide fragment (1) from Mycobacterium tuberculosis that is able to evoke a protective immune response against infections by mycobacteria belonging to the tuberculosis complex. The invention provides a (1) fusion to the tuberculosis complex. The invention provides a (1) fusion to the tuberculosis complex. The invention provides a (1) and at least one polypeptide fragment comprising a T-cell epitope from M. tuberculosis protein ESAFF, or MPT59 and a second different amino acid sequence from M. tuberculosis, protein ESAFF, or MPT59 and a second different amino acid sequence from In vivo a sequence which protects the first amino acid sequence from in vivo degradation or post-translational processing; (3) a nucleic acid fragment that encodes the above polypeptides. The polypeptides and nucleic acid fragment cuestul as pharmaculicals, for diagnosis of and as antigens for vaccination against TB caused by Mycobacterium tuberculosis, africanum or bovis. The polypeptides are also useful for diagnosis of as antigens for tuberculosis complex. The invention also describes the use of CFP7A or CFP3AAFF, or a frong immune composition in amimal with bacteria belonging to the tuberculosis complex. The invention also describes the use of CFP7A or CFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3AAFF, cFP3A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        163 ccggcgatgggcatgggggggtgtgggtttagatgcggccggttccggcgaggggggc 222

The present sequence encodes a Mycobacterium tuberculosis protein. Products from the present invention, which describes protein fragments and nucleic acid fragments derived from M.tuberculosis, can be used in the detection of and prevention of mycobacterial infections. In particular, the proteins and nucleic acids can be used for the diagnosis of or vaccination against tuberculosis caused by M. tuberculosis, M. africanum or M. bovis.
                                                                                                                                                                                                                                                                                                                               New isolated mycobacteria polypeptides and nucleic acids - used for developing products for the diagnosis of or vaccination against mycobacterial infections, particularly tuberculosis

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                        Gaps
                                     The present sequence encodes the Brevibacterium flavum JM-233 6-phosphogluconate dehydrogenase (6-PD). The 6-PD can be recombinantly produced by transforming coryneform bacteria with the DNA molecule encoding it.

trachomatis open reading frames (ORFS) of the genome encode polypeptides y36754-Y37949. The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microcorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and veneral lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Db 397222 ccrrrcrrcgaagagagagararrcrcarrgarggggggaaragcrarrarragarrcr 397163

gene cluster was isolated from a cosmid gene bank of E. coli M92 cfromosomal DNA by screening with E. coli Olll antiserum. Open reading frames within the gene cluster were identified on the basis of homology to known sequences. The genes encode proteins is case M88100-11) involved the synthesis of sugars present in the polysaccharide antigen, and in the transport or processing of polysaccharide or ollosaccharide units. The use of nucleic acid molecules derived from particular assembly and transport genes, particularly wbd (transferase), wax (flippase) and wzy (polymerase) genes, within O antigen gene clusters improves the specificity of methods for the detection and identification of O antigens. Esting food- or faecal-derived samples, or samples from patients. The O antigen is a major virulence factor of enteropathogenic E. coli strains that cause diarrhoea and haemorrhagic colitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          13157 gcagigatggggggggaaccigggggctcaacatcgaaagccggggttataccgtctccatc 13216

The present sequence encodes a bacterial response regulator (RR) protein which is a component of the two component signal transduction system (TCSTS). RR Polynuclectides and proteins are useful for diagnosing susceptibility to diseases by detecting mutations or polymorphisms in the RR gene or analysing for the presence of amount of RR protein expressed in a patient sample. RR PCR probes are useful for diagnosing diseases, and can characterise the response of the infectious organism to drugs. RR proteins and polynucleotides are also useful for screening for antagonists, agonists and drugs against infectious micro-organisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           microbial diseases, especially Streptococcus pneumoniae diseases including ottits media, bacteraemia, conjunctivitis, pneumonia, sinusitis, pleural empyema, endocarditis and especially meningitis. Epitopes of RR proteins and polynucleotides are useful immunogens for producing anti-RR antibodies for prevention of bacterial infections, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cus pneumoniae; response regulator; antibacterial; infection; bacteraemia; meningitis; otitis media; conjunctivitis; pleural empyema; endocarditis; gene therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RR agonists and antagonists are bacteriostatic and bacteriocidal compounds which can be used in treatment to enhance (agonist) or block

```

NAME OF THE PROPERTY OF THE PR

```
RR polynucleotides can be used in genetic immunisation (gene therapy) to prevent infections. RR proteins, polynucleotides and their (ant)agonists can prevent adhesion of bacteria to matrix proteins, and are useful for use on wounds and body implants to prevent bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ctcacttggagcagggcgactgcatcatcgatggggggaacgagtggtacgagaacacgg 312

pharmaceutical compositions and vaccines for Streptococcus pneumoniae

Claim 1; Page 1020-1021; 1409pp; English.

The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (V52134 to V52524) recorded on it, or a representative fragment or a sequence at least 95% identical to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO:1 to 391 (V52134 to V52524) are genomic fragments from Streptococcus pneumoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S.pneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced genome (SEW 1D NO:1 to 31) where the nutting and missions to process comprising: (a) screening a genomic DNA library using as a probe a target sequence defined by any of the sequences in SEQ ID NO:1 to 391, identifying members of the library which contain sequences to 391, identifying members of the library which contain sequences to 391, identifying members; or (b) isolating the nucleic acid molecules from the members; or (b) isolating mRNA, DNA or cDNA produced from an organism, amplifying nucleic acid molecules whose nucleotide fragment of the S. pneumoniae genome to prime the amplification and isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the S. pneumoniae genome. Products from the present fragments of the S. pneumoniae genome. Products from the present used in diagnosis kits and assays, and pharmaceutical compositions and vaccines for S. pneumoniae.

```
The present sequence encodes a 6-phosphogluconate dehydrogenase protein from Streptococcus pneumoniae. The protein induces an immune response against bacteria, causing production of antibodies that interfere with bacterial adhesion. The 6-phosphogluconate dehydrogenase, its fusion proteins and cells (or their membranes) are used to screen for specific as antibacterials and to raise antibodies. Antibodies are used as antibacterials and to raise antibodies. Antibodies are used as immunosasay reagents; for isolation or identification of therapeutic antibacterials. Conditions that can be treated include bacterial infections, by Helicobacter pylori, or especially by capterial infections, by Helicobacter pylori, or especially by protein or mutations in gene sequences encoding it can be used for the diagnosis, staging or monitoring treatment of infections, or determining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               susceptibility to them, particularly in standard immunoassays or hybridisation and amplification tests. Nucleic acids encoding the protein may also be used for chromosomal mapping and identification, for genetic immunisation or the rational design of (ant)agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New 6-phosphogluconate dehydrogenase from Streptococcus pneumoniae, and related proteins, used to screen for antibacterial agents, to treat infections and to raise diagnostic antibodies

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access medium, preferably selected from a floppy or hard disk, random access the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial; therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, coalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for the polypeptides. The new DNA sequences can the transformed as primers or probes for isolating chomologues of any of the S.aureus DNA sequences contained on the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ï

The present sequence represents a Amycolatopsis mediterranei rifamycin synthesis gene cluster DNA fragment from the present invention. The DNA fragment comprises a DNA region involved directly or indirectly in the gene cluster responsible for rifamycin synthesis, including the adjacent DNA regions to the right and left which, by reason of their function in connection with rifamycin biosynthesis, qualify as constituents of this rifamycin gene cluster, and functional fragments, derivatives or constituents of these. The Amycolatopsis mediterranei rifamycin synthesis gene cluster DNA fragment can be used for producing rifamycin, rifamycin analogues or precursors. It can also be used for inactivating or modifying genes involved in ansamycin or rifamycin biosynthesis. The DNA can be used for constructing mutant actinomycetes strains from which the natural rifamycin or ansamycin biosynthesis gene cluster has been partly or completely deleted. The DNA can be used for assembling a library of polyketide synthases, which can be used for assembling a library of polyketide synthases, which can be used for assembling a library of polyketide synthases, which can be used for assembling a library of polyketide synthases, which can be used for assembling a library of polyketide synthases, which can be losed for assembling a library of polyketide synthases, which can be losed for assembling a library of polyketide synthases, which can be losed for assembling a library of folyketide synthases, which can be losed for assembling a library of polyketide synthases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        21394 CCCGGCCGTCCTCGGCCATGCCGCGCTGCGCGACATGCCGATGACACGATCGGCGAGC 21335

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A DNA sequence (T63571) codes for a novel xylanase (W09777). It was isolated from a phagemid in a soil DNA library using as probe a gene fragment (T63568) obtd. by amplification of soil DNA using degenerate primers (T63548-49) based on conserved portions of family F cellulases. It was sequenced by primer walking over the phagemid insert using the same degenerate primers as initial extension primers. Subsequent extension primers were constructed by examining the previously generated sequence data. The novel xylanase gene can be used for prodn. of xylanase for industrial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           309 acggagagaggagaaggccatggaggagcggcctnctgtatcttggcatggg 364

The present invention describes isolated polynotrocuses (FW) comprises the present invention described are: (A) a chimeric gene (CGI) used to produce a transgenic monocot plant, comprising: (I) a transcriptional regulatory region which hybridises under high stringency with a rice beta glucanase promoter; and (ii) a DNA sequence heterologous to the regulatory region, and encoding a protein to be produced by the plant; cand (iii) a second DNA sequence encoding a signal polypeptide operatively linked 5 to 3', so that the signal polypeptide is in translation frame with the protein, and is effective to facilitate secretion of the protein are plant; (B) a monocot plant stably transformed with CGI; (C) seeds from the above plant; (D) a method of enhancing the stably transformed of a monocot plant to fungal infection by stably transforming it with CGI; (E) seeds from the above plant; (D) a method of enhancing the restsing stably transforming a plant with CGI, obtaining the protein, comprising stably transformed plant, germinating the seeds and obtaining the protein from the seed endosperm; (F) an isolated protein having the draracteristics of a rice beta-glucanase enzyme, corresponding to beta-glucanases 2.9 a rice beta-glucanase enzyme, corresponding to beta-glucanases 2.9 a rice beta-glucanase resistance of fungal infection, improved growth corresponding to heterologous proteins in contact plants. The polynucleotides and the proteins produced may also provide increased resistance to fungal infection, improved growth contact relations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes isolated polynucleotides (PN) comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 561 CCCGAGCTGCACGCTGCTCCGCGCCCCTACGCAAGTAGGGGGTACACGTTCACCAG 502

The present invention describes isolated polynucleotides (PN) comprising a sequence which hybridises under high stringency with a rice beta-glucanase gene. Also described are: (A) a chimeric gene (CGI) used to produce a transgenic monocot plant, comprising: (i) a transcriptional regulatory region which hybridises under high stringency with a rice beta glucanase promoter: and (ii) a DNA sequence heterologous to the regulatory region, and encoding a protein to be produced by the plant; and (iii) a second DNA sequence encoding a signal polypeptide operatively linked 5' to 3', so that the signal polypeptide is in translation frame with the protein, and is effective to facilitate secretion of the protein caross aleurone or scutellar epithelium layers into the endosperm of seeds obtained from the plant; (b) a monocot plant stably transformed with CGI; (C) seeds from the above plant; (D) a method of enhancing the transforming the transforming the carbot stans of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               It with CG1; (E) a method of producing a heterologous protein, comprising stably transforming a plant with CG1, obtaining seeds from the transformed plant, germinating the seeds and obtaining the protein from the seed endosperm; (F) an isolated protein having the characteristics of a rice beta-glucanase enzyme, corresponding to beta-glucanases 2-9 (En 2-9). The polymucleotides of the invention are useful to transform monocot plants. The polymucleotides and the protein produced may also provide increased resistance to fungal infection, improved growth characteristics, and high expression levels of heterologous proteins in various tissues obtained from the plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polynucleotides which hybridise with rice beta-glucanase genes useful for transforming monocot plants for various characteristics including increased resistance to fungal infection
                                                                                                                                                                                                                                                                                                      Rice; beta-glucanase; Gns; promoter; plant resistance; expression; fungal infection; transgenic monocotyledon; growth; ss.

NAME/KEY: DNA sequence encoding
NAME/KEY: Streptomyces lividans Protease X
OTHER INFORMATION: bp 12 to 1910 comprises
OTHER INFORMATION: S. lividans DNA sequence, including Protease X.
OTHER INFORMATION: bp 1 to 11 represents cloning vector DNA sequence.
